Friedrich-Alexander-Universität Erlangen-Nürnberg

Overview

This report summarizes the distribution of qualitative data projects and qualitative data analysis (QDA) projects identified from two repositories: Zenodo and DANS.

The analysis focuses on classifying projects according to ISIC primary classes. For each repository, the report provides class distributions using histograms, rank-ordered tables of the twenty most frequent classes, and observations about the identified patterns.

Total Number of Distributions Reported

Repository	QDA_PROJECT Count	QD_PROJECT Count
Zenodo	45	613
DANS	9	348

Table 1: Breakdown of QDA and QD Project Distributions by Repository

The table provides an overview of the total number of distributions analyzed from both repositories. The following sections analyze the ISIC primary class distribution individually for each repository.

1. Repository: Zenodo

a. Histogram of Primary Classes Identified

Figure 1: Histogram of Primary ISIC Classes in Zenodo Repository

b. Rank-Ordered List of Classes (Top 20)

Rank	ISIC Primary Class	Count
1	Computer programming, consultancy and related activities	140
2	Advertising and market research	104
3	Human health activities	72
4	Education	51
5	Employment activities	39
6	Printing and reproduction of recorded media	21
7	Scientific research and development	13
8	Manufacture of wood and wood products	13
9	Manufacture of tobacco products	13
10	Architectural and engineering activities; technical testing and analysis	14
11	Veterinary activities	14
12	Libraries, archives, museums and cultural activities	12
13	Activities of extraterritorial organisations and bodies	10
14	Residential care activities	10
15	Creative, arts and entertainment activities	9
16	Security and investigation activities	6
17	Telecommunications	6
18	Other personal service activities	6
19	Construction of buildings	12
20	Manufacture of basic pharmaceutical products and preparations	12

Table 2: Top 20 ISIC Primary Classes in Zenodo Repository

c. Comments on Findings

The Zenodo repository demonstrates strong representation of computational, research, health, and educational domains. Computer programming and market research form the dominant classes, while the remaining categories show broad thematic diversity across scientific, cultural, and manufacturing-related activities. The evaluation results support the reliability of these findings: a high stability score (0.700) indicates consistent project-level classifications across files, and the most common class (ISIC 62) also showed strong semantic coherence in the interpretability analysis, confirming that the dominant categories in the histogram align with meaningful project themes.

2. Repository: DANS

a. Histogram of Primary Classes Identified

Figure 2: Histogram of Primary ISIC Classes in DANS Repository

b. Rank-Ordered List of Classes (Top 20)

Rank	ISIC Primary Class	Count
1	Security and investigation activities	55
2	Printing and reproduction of recorded media	48
3	Employment activities	25
4	Postal and courier activities	23
5	Advertising and market research	22
6	Manufacture of basic pharmaceutical products and preparations	22
7	Manufacture of tobacco products	22
8	Libraries, archives, museums and cultural activities	16
9	Veterinary activities	14
10	Activities of extraterritorial organisations and bodies	12
11	Other personal service activities	11
12	Creative, arts and entertainment activities	11
13	Human health activities	10
14	Computer programming, consultancy and related activities	6
15	Construction of buildings	6
16	Education	5
17	Accommodation	5
18	Public administration and defence; compulsory social security	5
19	Residential care activities	4
20	Programming and broadcasting activities	4

Table 3: Top 20 ISIC Primary Classes in DANS Repository

c. Comments on Findings

The DANS repository shows strong concentration in security, media-related, and employment activities. A small number of classes contribute a large proportion of the total projects, while the remaining classes form a long tail of less frequent categories. The evaluation results reinforce the reliability of these findings: a high stability score (0.743) indicates that project-level classifications remained consistent even when individual files varied in quality or extractability, and the most common class (ISIC 80) also demonstrated strong semantic coherence in the interpretability analysis, confirming that the dominant categories in the histogram align with meaningful project themes.
